

## **AMBER: Let it Flow**

Piotr Parasiewicz et al

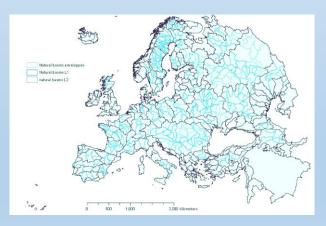

S. Sakowicz Inland Fisheries Institute

## Adaptive Management of Barriers in European Rivers

#### 1. European Barrier Atlas

- 2. Barrier guidance
- strategic
- adaptive
- practical

Planning (location)

mitigation

## Collaborative?

#### 20 participant institutes:

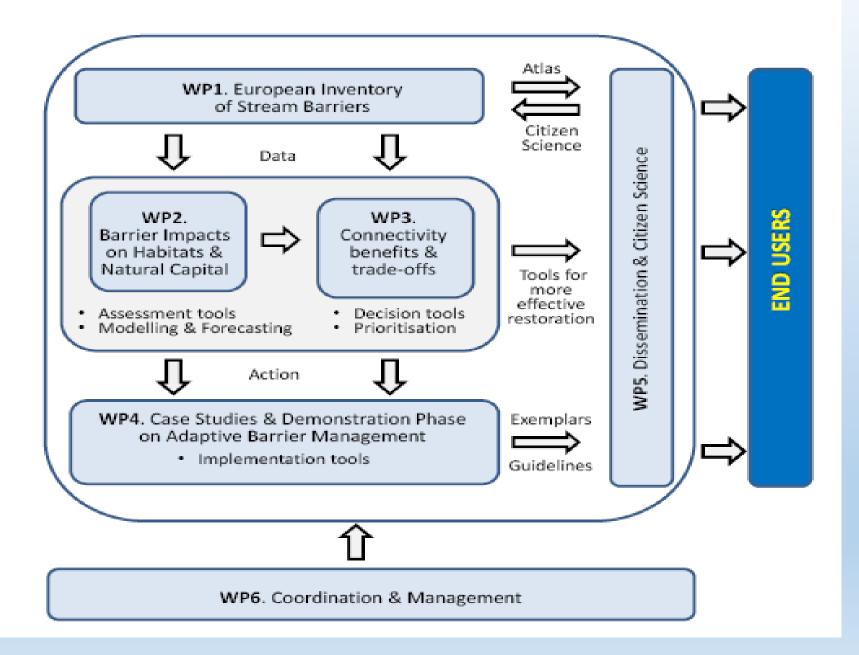

**8 Universities** - Swansea, Durham, Highlands & Islands, Southampton, Cork (Ireland), Oviedo (Spain), Milan (Italy), DTU (Denmark).

**4 Industrial partners** - hydropower – EDF (France), IBK (Germany), Innogy (Germany), Sydkraft (Sweden)

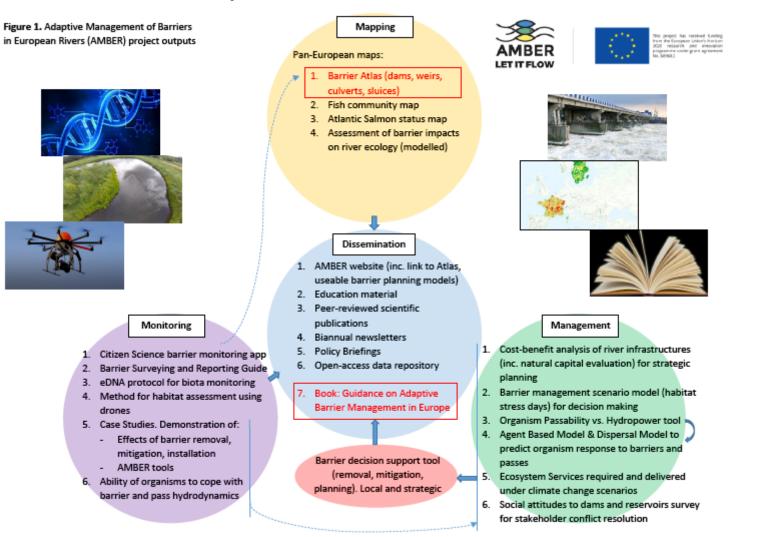

4 NGOs (WFMF (Netherlands), WWF (Switzerland), CNSS (France), AEMS (Spain)

**4 Government organisations** - IFI (Ireland), ERCE (Poland), SSIFI (Poland), Joint Research Centre (Italy)

#### **AMBER Pert diagram**

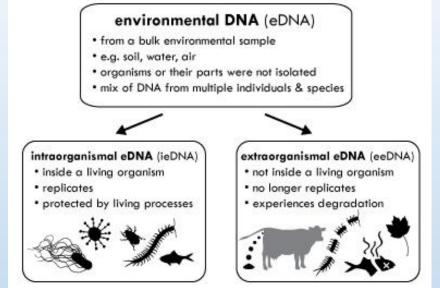

### **AMBER** outputs

#### New opportunities for restoring river connectivity

- 1. New technologies
- eDNA/meta-barcoding

• Drones for quick surveying & remote sensing

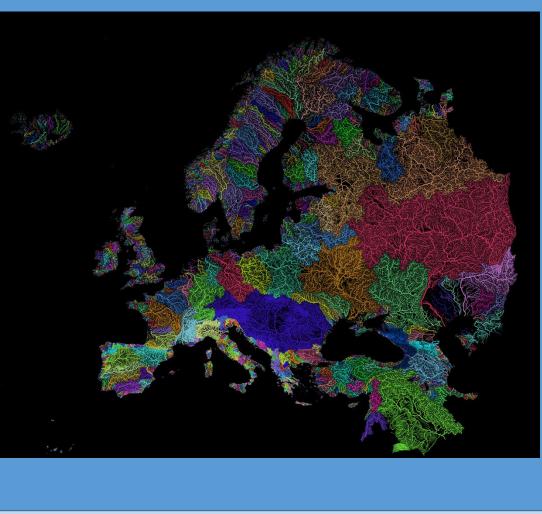

Modelling P/A (PREDICTS approach)

## European Rivers systems

- Connecting continents with oceans
- Biological distribution pahtways
  - transportation
  - communication
  - processess

#### **Rivers: Arteries of life**

www.dailymail.co.uk/sciencetech/article-6511869/Fascinating-new-map-shows-river-basin-globe-different-colour.html

### Impacts of dams

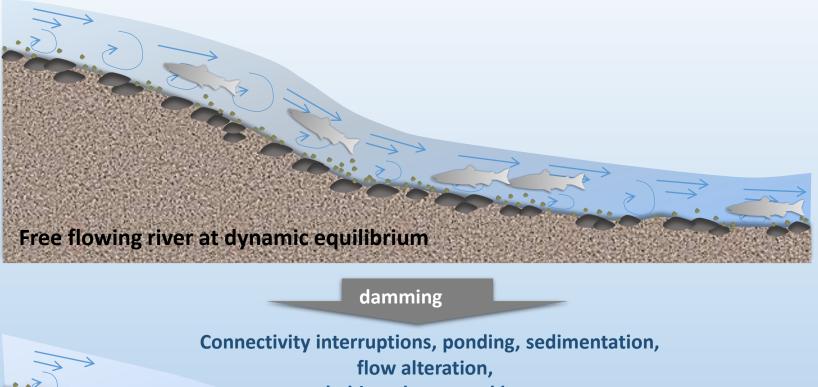

• altered or stopped fish upstream migration

- fish mortality:
  - dewatering
  - turbines

Phot. P. Prus, M. Adamczyk SSIFI

#### Dam impact on free flowing river

habitat change and loss

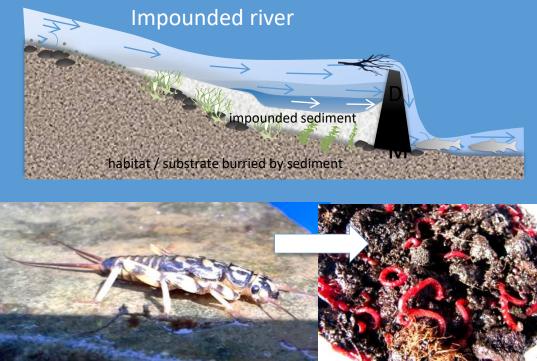

Modified from L. Wildman - The Effects of Dams on Floodplain Function

## Dam impact on upstream habitat

- higher depth
- low velocity
- substrate siltation
- high temperature
- low oxygen
- eutrophication
- vegetation shift
- benthos shift

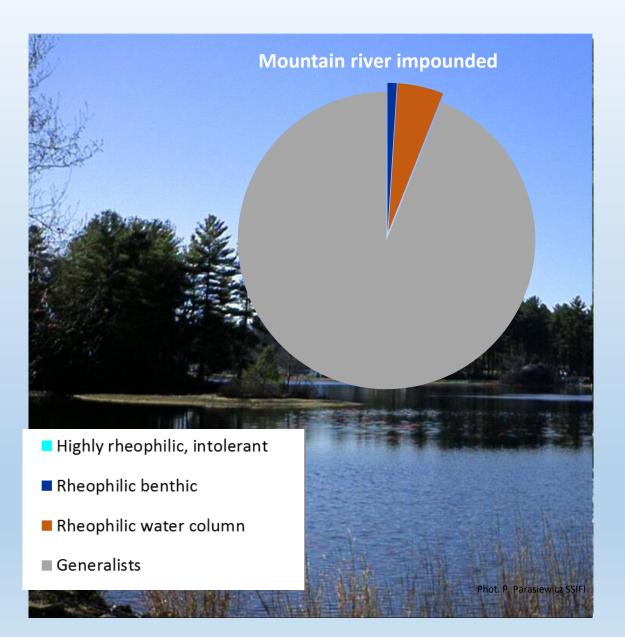

#### Upstream

 rheophilic fish guilds in undisturbed river

- change of lotic into lentic habitats
- altered fish community
- generalists tolerant fish in impounded river

#### Dam impact on downstream habitat

- flow regime
  - fluctuations:
    - depth
    - velocity
    - temperature
- blocked sediment
  - riverbed erosion
  - sediment armoring
- Dewatering (mortality)

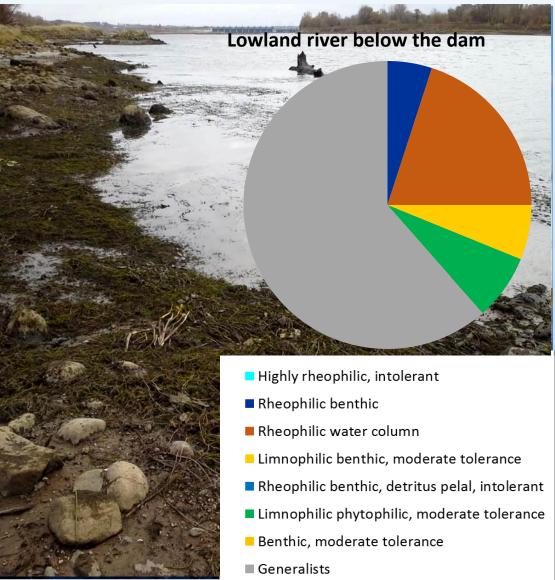

Phot. K. Susuka, P. Parasiewicz SSIFI

#### **Downstream**

- change of habitat quality and stability
- rapid bottom erosion

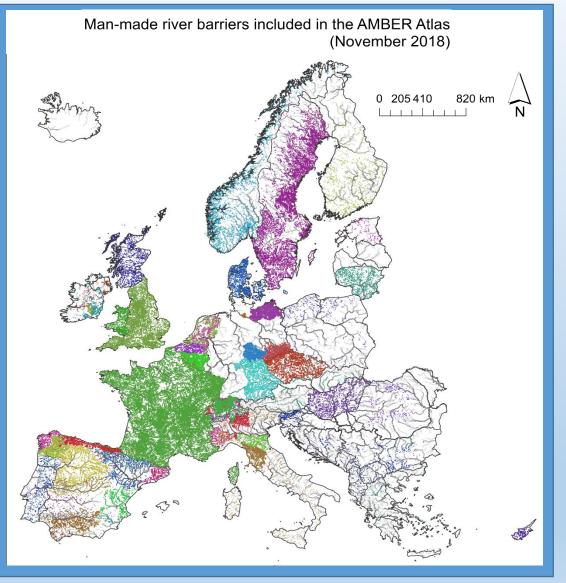

altered fish community

### Barriers on European Rivers

• **400.000** recorded in AMBER ATLAS (status Nov 2018)

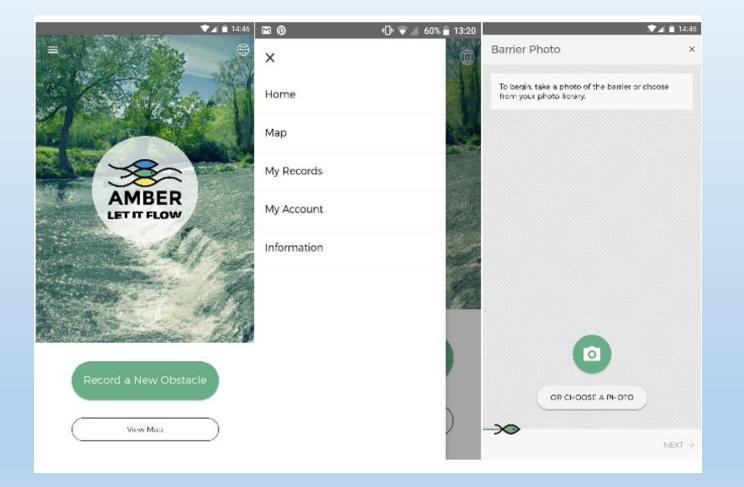

> A barrier every river kilometer

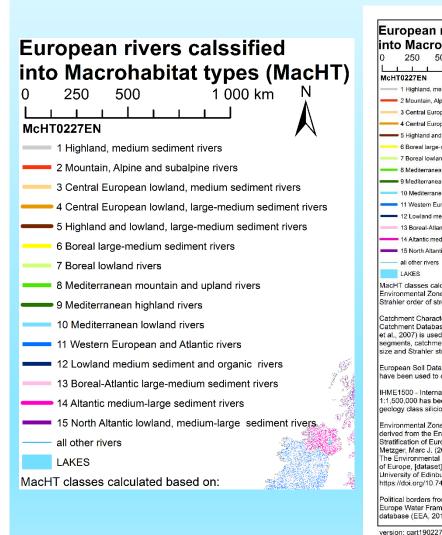

SOURCE: AMBER project

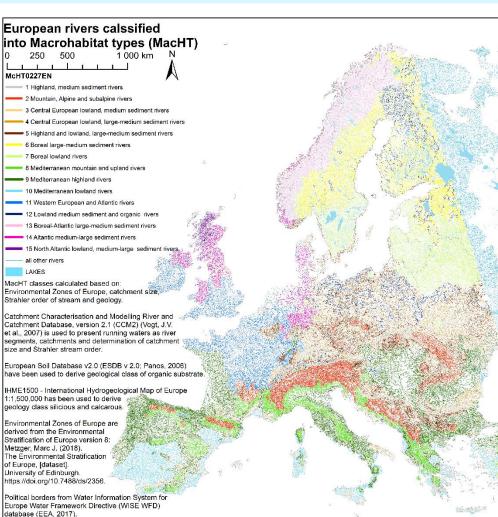

## AMBER Barrier Tracker

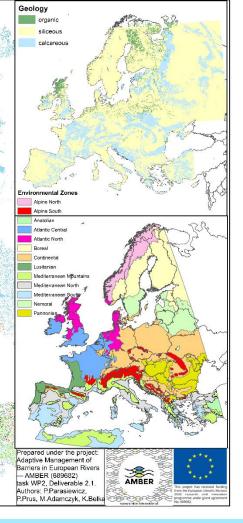

### European River Classification based on Intercalibration Database

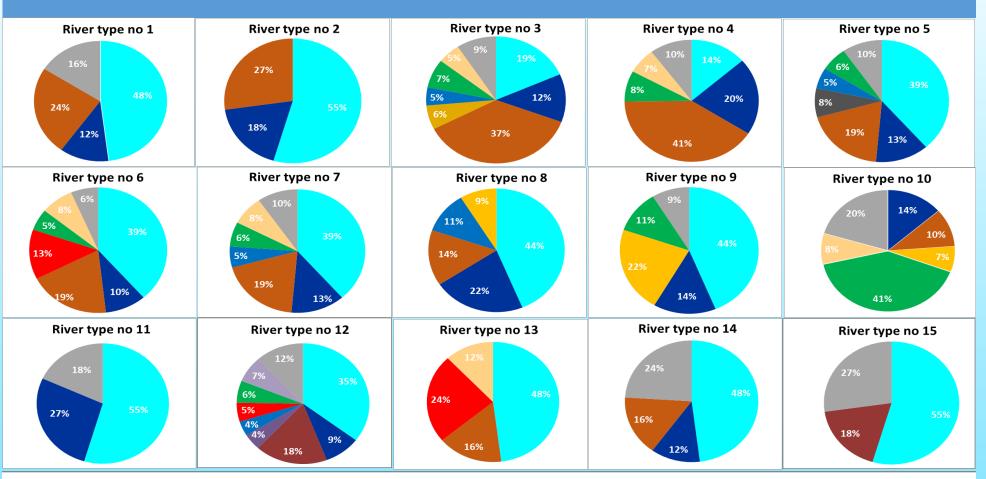

#### **Fish MacroHabitat River Types**

- Highly rheophilic, intolerant species
- Rheophilic water column species, preferring sandy-gravel bottom substrate
- Limnophilic water column species of moderate tolerance
- Intolerant, water column species
- Limnophilic phytophilic species of moderate tolerance
- Generalists tolerant species

- Rheophilic benthic species, preferring sandy-gravel bottom substrate
- Limnophilic benthic species of moderate tolerance
- Intolerant, rheophilic benthic species, preferring detritus or pelal bottom substrate
- Limnophilic lithophilic species of moderate tolerance
- Benthic species of moderate tolerance

# D2.2 Conceptual model of barier impact on fish habitats GEP: reference

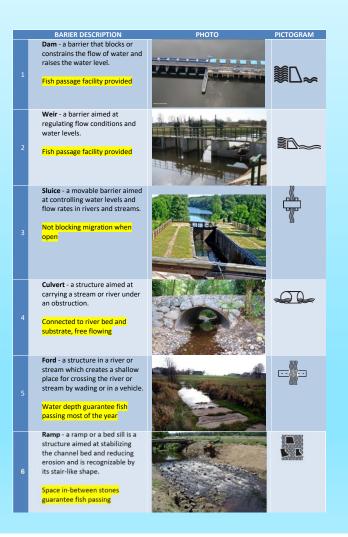

Table 4. Weighted remaining habitat proportion (wRHp) with regard to barrier type and ECMacHT.Red – severe habitat loss (<10), orange – major habitat loss (10-50%), yellow – significant habitat</td>loss (50-75%), green – moderate habitat loss (75-90%), blue – low habitat loss (>90).

		₩□~				<b>.</b>

## **Rapid Barrier Passability Assessment Tool**

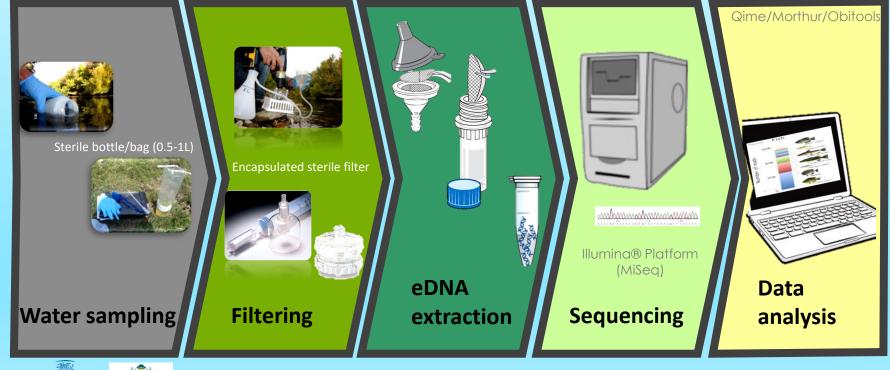

- Barrier types assessed include:
  - Sloping weir, vertical weir, culvert, rock ramp, ford, sluice gates.
- 47 different species/lifestages assessed
- Typical input parameters include:
  - Slope, head-drop, water depth, plunge pool depth, step heights etc...
- The tool was coded in Matlab but functions as a stand-alone bit of software that will run on a standard Windows computer.
- Software and installation and user guide available of AMBER website.

Task 2.5 Molecular toolkit: development of primers, protocols and pipelines (D2.5 - 100%)

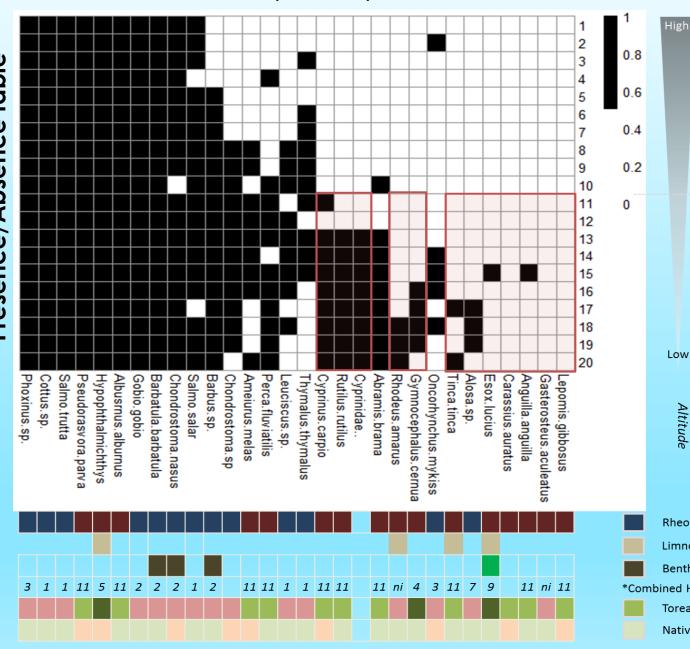

eDNA workflow

#### **CASE STUDY:** River Allier (France)

#### Fish – Preliminary Results

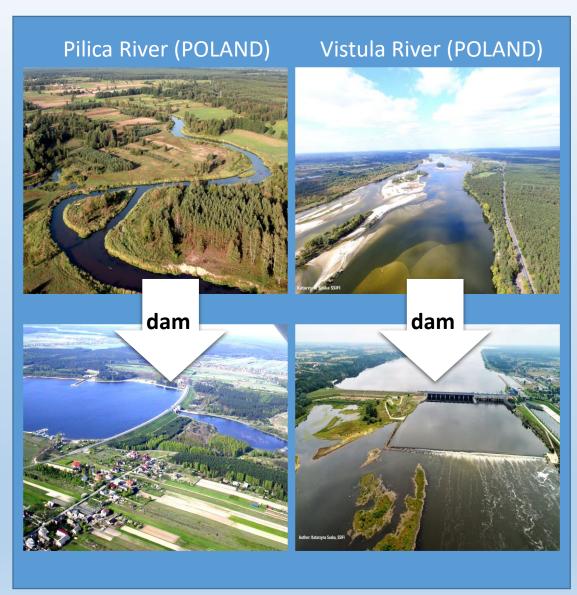

- Altitude and distance to the dam are significant predictors of the presence of some species such as: Abramis brama (Freshwater bream), Rutilus rutilus (Roach), Rhodeus amarus (European bitterling), Gymnocephalus cernua (Ruffe) and Ameirus melas (Black bullhead).
- and cumulative • Altitude height are significant predictors of the presence of Alosa sp. (Shads).
- A higher relative proportion of rheophilic to the dam Distance species is detected upstream the Poutès dam

eDNA

Investigating and mitigating impact of barriers

- Define habitat changes up- and downstream
- Develop mitigation scenarios
- Compare and select

15

Phot. ERCE, K. Susuka, P. Parasiewicz SSIFI

#### Rapid stream mapping

- Drone pictures, movies, digital terrain models
- Spherical photography
- Bathymetric, hydraulic surveys
- Field survey App

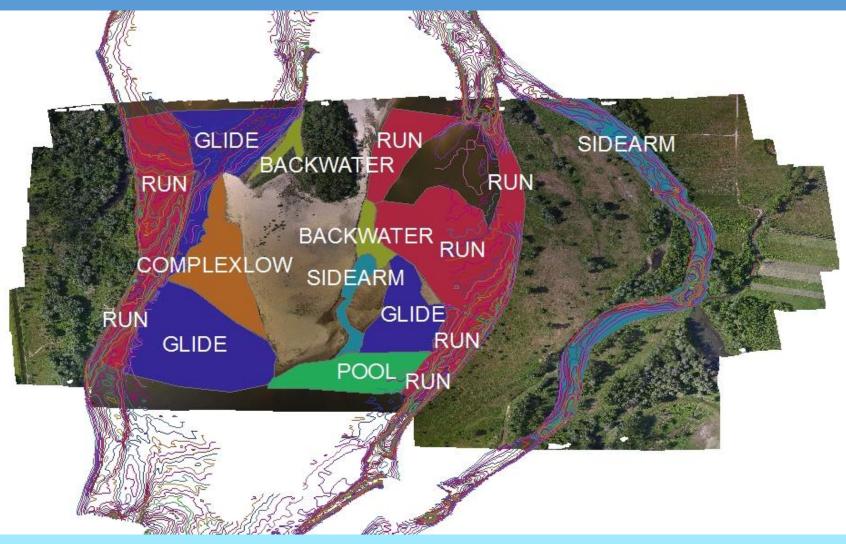

## Mapping of large rivers

Middle Vistula River, 2016

#### Wisła River UAV photos + bathymetry + HMU

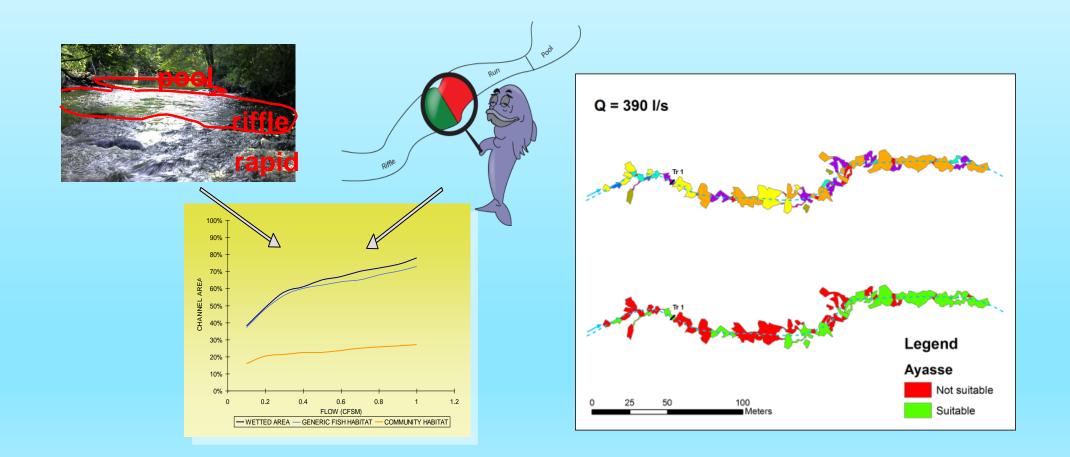

## 3D model of Sesia River (IT) obtained form drone work

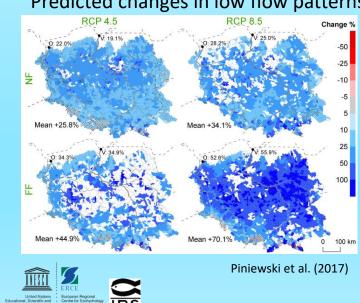

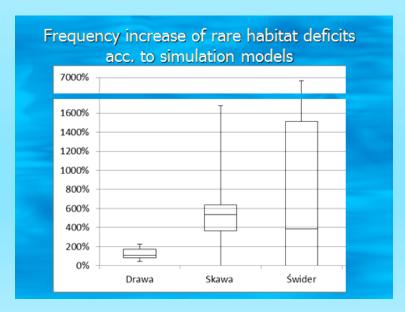

## Habitat models of barrier effects on riverine habitats

#### Modelling stream barrier effects under different scenarios of climate change

- Develop scenarios for impact of climate change on fragmentation in representative watersheds
- Habitat time series analysis
- Test model validity
- **Apply Restoration Alternatives Analysis**

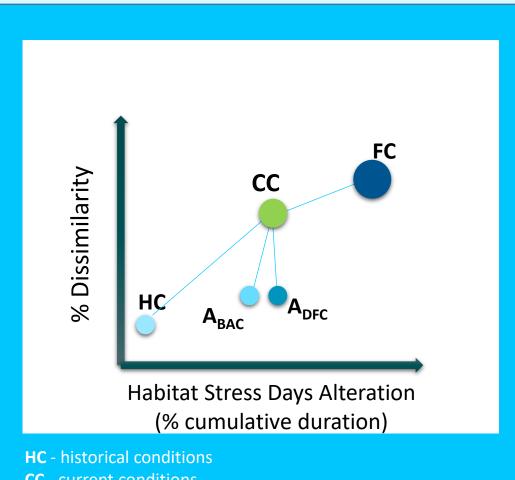

Predicted changes in low flow patterns

#### Modelling stream barrier effects under different scenarios of climate change

- Develop scenarios for impact of climate change on fragmentation in representative watersheds
- Test model validity
- Apply Restoration Alternatives Analysis

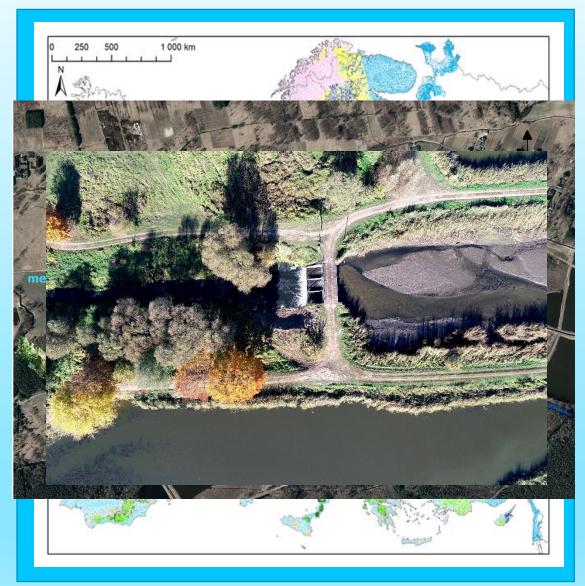

CC - current conditions FC - future conditions A<sub>DFC</sub> - Desired Future Conditions alternative A<sub>BAC</sub> - Best Available Conditions alternative

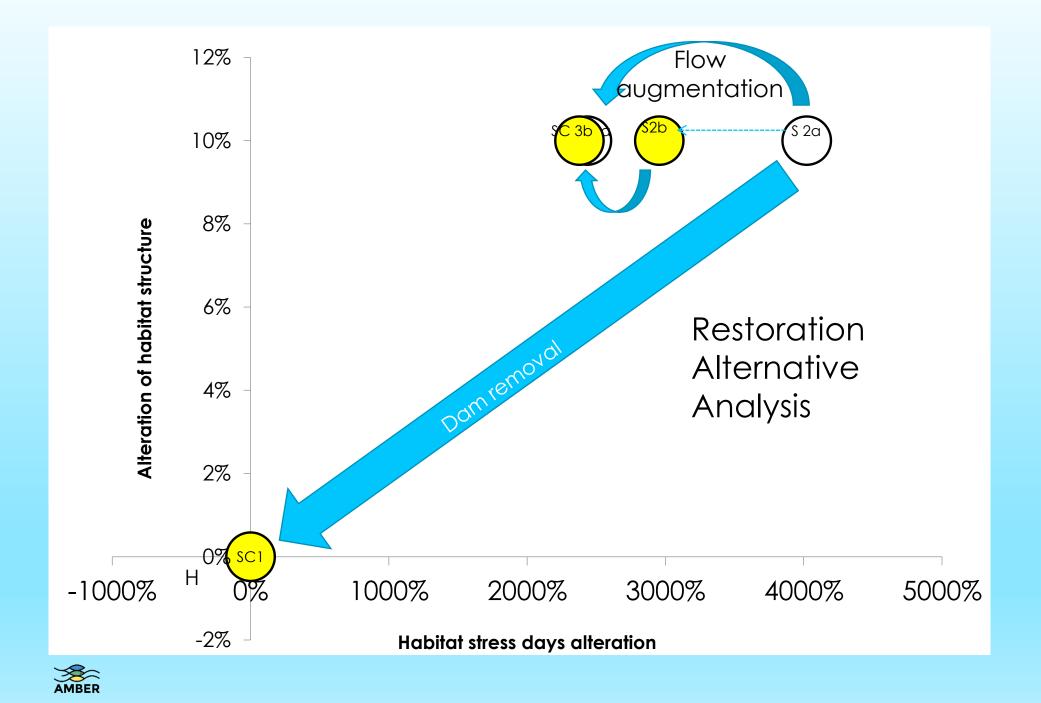

#### MesoHABSIM MODEL

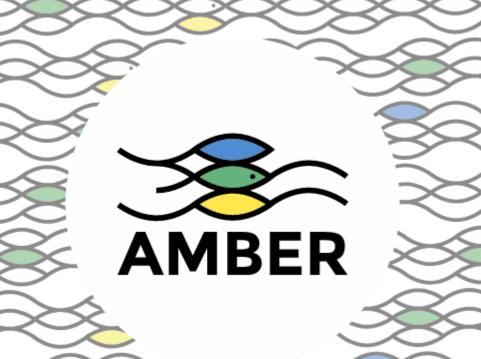

#### Example of application: Mienia River (Central Poland)

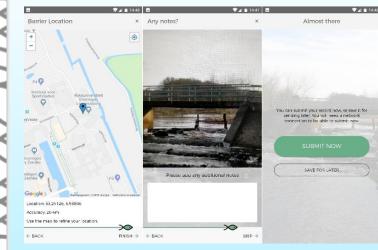

- Watershed Area 256 km<sup>2</sup>
- Stream Order 1-3 (Strahler)
- Siliceous surficial geology
- Low gradient, sandy bottom
- Average width 5 m
- Has many small barriers and a dam to supply water for fish farm
- No fish passage

#### AMBER FIELD DATA COLLECTION MANUAL

This is the 1.0 version of the AMBER FIELD MANUAL. This document is a part of deliverable 5.10 -BOOK ON BEST GUIDANCE ON ADAPTIVE BARRIER MANAGEMENT IN EUROPE, of the AMBER project, which has received funding from the European Union's Horizon 2020 Programme for under Grant Agreement (GA) #689682.

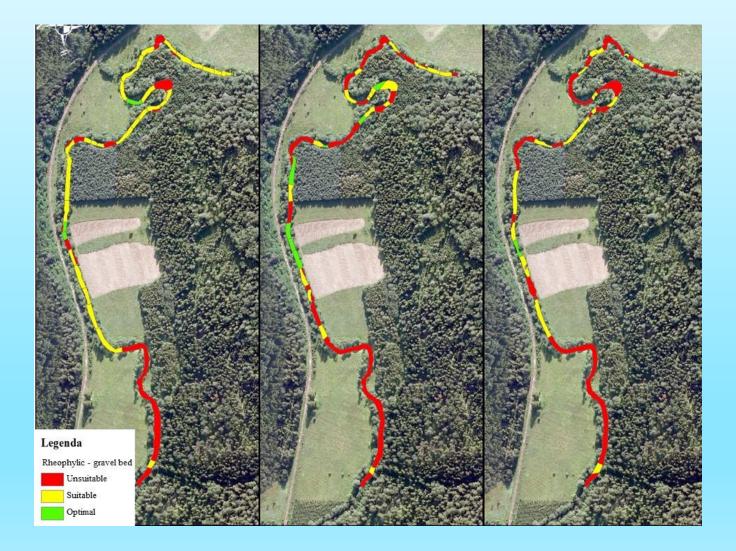

## Process of establishing e-flows for FCMaCHT

## **MesoHABSIM model**

### Calculating e-flows in non-modelled locations

$$Q_{sef,k} = p_b \cdot q_{MBLF,k} \cdot A_k$$

 $p_b$  = tabulated value of index obtained from

pilot studies specific for bioperiod and

**FCMacHT** 

 $q_{MBLF,k}$  = specific mean low flow for the bioperiod at the

cross-section k

 $A_k$  = catchment area at the cross-section k

# Standard deviation of e-flows calculated with four methods

- 6 FCMacHT
- MesoHABSIM
- Standard setting Kostrzewa
- Wetted Perimeter
- R2Cross
